

EXP-1

Comparative study of low code development versus traditional application development approaches

Aim:

To compare traditional application development and low code application development based on their features, advantages and disadvantages

Features of traditional vs lowcode :

Traditional development	Low-code development
* Required programming language & knowledge * Developed using languages like Java, Python, C, etc. * Longer development time * High flexibility and customization * Suitable for complex applications	* Minimal coding required * Uses drag and drop interface * Faster development time * Limited Customization * Suitable for simple to medium business application

Advantage of Traditional vs low code.

Traditional Development:

- * Highly customizable
- * Suitable for large and complex projects
- * Better control over application design and performance
- * Supports advantage integration

Low Code Development:

- * Faster application development
- * Requires less coding knowledge
- * Reduces development cost
- * Easy maintenance and updates

Disadvantages of traditional vs low code:

Traditional development:

- * Time consuming
- * Requires skilled developers
- * Higher development and maintenance cost
- * Longer testing and deployment process

Low code Development:

- * Limited customization option
- * Vendor dependency
- * May not be suitable for highly complex application
- * Licensing cost for enterprise platforms

Comparison of traditional vs low code:

Traditional development	Low code development
* Takes more time to develop applications * Requires strong programming skills * Highly flexible and customizable * Higher development and maintenance cost	* Develops applications much faster * Requires little to no programming skills * Limited customizable option * Lower development and maintenance cost

Result:

Thus, the comparison of traditional and low code developments has been completed successfully.
